

FINAL TASK RELYMER LABS

Name: Saqib Aziz

Task: Fetch data from 2 API sources and display comparison then finally store in a database.

Status: completed on time

Output url: <https://charming-mooncake-089230.netlify.app/>

Code url: <https://github.com/Saqib-Aziz33/relymer-final-task>

Task solving steps:

- I researched about both API's (binance and crypto), and test their endpoints.
- The **binance.com** API was working fine, i.e providing the required data.
- But the **crypto.com** API requires cell phone verification and there was no verification method provided for **pakistani +92** code.
- Then i created a user interface in react.js which displays data from **binance.com** API.
- After that i did more research about **crypto.com** API but noting work's.
- Then finally i visits crypto.com and get their symbols price and store in a javascript file.
- Then displays the differnce between both datasets.
- Finally stores the data in the firebase.
